Green Economy Sector

Senegal wants to move towards a sustainable economy. The country, which has a large biosphere reserve, has embarked on an energy transition by increasing the use of renewable energy. This creates investment opportunities in wind, solar and hydroelectric power. The government offers tax incentives and support for clean energy to attract investment. Senegal has a strong potential in renewable energy thanks to its sunshine and its wind and hydro resources. Other sectors of sustainable development such as sustainable agriculture, waste management, eco-tourism and environmental protection are also growing strongly.
