

Large Areas of Fodder Crops

Intervention Zone	The entire national territory
Description of the Project	<p>To ensure abundant and quality fodder production, capable of supporting emerging animal value chains, the practice of fodder crops is essential. This project will therefore target the implementation of dedicated facilities to ensure a permanent supply of quality fodder.</p> <p>Thus, the project will allow the development of 2,000 ha thanks to the transfer of water in the Diéri and the establishment of 40 fodder farms in areas far from watercourses. These farms will be connected to boreholes equipped with solar energy to reduce operating costs. In addition, 200 silage sites will be built in the production areas and 200 subsidized tractors will be provided. The acquisition of 10 mobile silage systems will provide services to farms that produce sorghum and corn in the rainfed system. To facilitate the storage and conservation of fodder, 200 sheds will be set up at the 200 silage sites.</p>
Expected impact	<ul style="list-style-type: none"> ▪ reduction of the dependence of fodder availability on rainfall and crop residues ▪ livestock food security
